

Advanced Inventory

The Advanced Inventory extension can improve the flexibility of your SAP system by allowing you to change a kit in order entry and to also substitute for different parts. With this, component allocation is immediate.

Below is an illustration highlighting some of the useful features of the Advanced Inventory extension.

The screenshot shows the 'Part Summary Status' window for item 1265. It displays various fields for item identification and quantity requirements. A table below lists lot quantities and availability for different lots. Callouts highlight specific features: 'Provides visibility to incoming shipments' points to the 'Lot Avail' column; 'Can add and delete parts' points to the 'Add Item' field; and 'Maintains Lot Allocation and tracks quantity and availability' points to the 'Lot Qty' and 'Lot Avail' columns.
